based and cross-platform. All
you have to do is call a Java
program from a Command
Prompt. KeyMacro is a
command-line tool that takes
a set of files or directories
and analyzes their manifest
files. It is built on top of the
Macrosniffer library and
performs multiple analysis
tasks. For instance, the
KeyMacro.md.pdf has a
reference to the
Macrosniffer.jar library in the
lib folder, and the
KeyMacro.md.txt file

contains a hash that links to the hash file for the library. This hash file contains the hash of all known macros. KeyMacro is not a standalone application and requires Macrosniffer to work. It was written to assist users with basic IDPF validation of Macrosniffer and its results. KeyMacro can work on any directory, or even multiple directories with wildcards if you wish. You can run it on files or directories by supplying a file type or wildcard. The first argument to KeyMacro is the name of

the directory to scan.

KeyMacro's interface is fairly simple and easy to use: Figure

The first window you see is

the main view. It shows the

folder or files you pass as

arguments to the program.

The next window is the

analysis result, and it shows

the hash file. The last window

is the manifest file. It shows

the list of macros and their

information. The analysis

result shows the hashes of the

defined macros, and the hash

file has the hashes of all the

macros as well. The last

window shows the collected results for the specified file or folder(s). The four windows at the bottom of the program have a Help button to show a help message about their usage. There is a separate help file included with the download for more detailed information. After the analysis is done, you can click the Download hash file button to download a local copy of the hash file. This file contains the hashes of all the macros that were used in the analysis. In addition, the Macrosniffer.jar file

EpubCheck is a command-line application designed to help you validate IDPF ePub files, in order to identify various types of errors, such

as OCF container structure, OPF and OPS markup, and internal reference consistency. Introduction to Publisher Toolbox IDPF is a publisher's community that will let you publish ebooks and other digital content to any device. In other words, it is a series of open standards developed by independent organizations, aimed to aid publishers and developers in creating digital content for the web and mobile platforms. One of its main goals is to provide a methodology for cataloguing and describing

books and other digital content, especially for the purpose of linking them to the Web. The data file for an e-book is known as an ePub file, and it should comply with the IDPF data format. Another goal is to serve as an aid for mobile e-book readers, to create a common platform for reading e-books and many other digital files. In other words, IDPF aims to provide a framework that is independent of software providers and their devices. If you are a publisher, you can use an HTML editor to create

your own content; it can be published through a simple web service that is made available to everyone. Once your content is ready, IDPF can serve it, whether it is an online or offline document. The organization will provide a free web service that will let you generate a Reader Preview and also let you import your content to your reader. You can publish the web service that IDPF provides, and you will be able to add to it any metadata and content that you want. As I noted earlier, inside the folder

of the downloaded file, you will find a file named EpubCheck. The EpubCheck file is a simple Java application, which is designed to help you validate ePub files. In other words, it aims to check whether they are compliant with the format, and if not, it will let you know about the details of the errors. The application will not modify the contents of the ePub file, but it will report on it. You should use the downloaded application from this location and double-click on the file to open it. The

program will immediately open and begin to show any errors and warnings. All you have to do is click on the Continue button to view more details. When running the application, you will be able to choose which ePub file to check, how many times to check it, and how to output the results. While checking, EpubCheck will automatically generate a log file, showing the steps it takes while evaluating the ePub file. If you decide to save a copy of the log file, it will appear in the same location. I tested this

Java application and it behaved correctly, with no issues or errors. Instructions for using EpubCheck To run the
