online. Reducing noise (red eye) This example shows you how to remove noise (red eye) from a portrait. You work on a layer in this case, because working on a background creates new problems. You can work on a layer until it is active and change the entire background by using the Select Contents tool (Command/Ctrl+A).

1. Create a new, white Background Layer, as shown in Figure 3-2.
2. Go to the Layers panel and right-click (Windows) or Control+click (Mac OS) the Background layer to activate the Layers panel menu. When you see the Layers panel shown in Figure 3-3, press the eye icon to activate the Layers panel menu. Click the eye icon to hide the panel. **Figure 3-2:** Bring up the Layers panel before editing so you can see the layer in the background. **Figure 3-3:** Activate the Layers panel icon to see an assortment of layers.
3. Click Layer⇒Blend If⇒Merge Visible.
4. Create a new, black Background layer on the new, white Background layer.
5. Invert the new, black Background layer to leave only the white Background layer visible.
6. Create a new layer on the black Background layer.
7. Paste in the photograph that has the red eye by Ctrl+V-ing (Command+V-ing on a Mac) or pressing Ctrl+V.

In this post, we'll compare Photoshop and Photoshop Elements side by side. We'll talk about the main differences between the two programs, their features and software preferences and tutorials on photo editing. What is Photoshop? The Photoshop software is the best overall solution for editing and compositing your photos. It is one of the best graphics programs on the market, and it is extremely popular and helpful for graphic designers. But, it is not for every photographer and the reason is that it is a fully featured photo editing tool. It also includes most of the features of a digital artist's software: text editing, video editing, 3D, audio editing and more. In this way, Photoshop is like the Swiss Army knife for image editing. If you just want a "simple" photo editor, then Photoshop Elements is a much better option than Photoshop. Adobe Photoshop vs Photoshop Elements What are the main differences between Photoshop and Photoshop Elements? In general, Photoshop has more functions and more

---

features than Photoshop Elements, even though it also has some limitations. This table shows the main differences between Photoshop and Photoshop Elements:

Photoshop	Photoshop Elements
Most common features	Basic features
Maneuvering and framing	Viewing and printing
Image adjustment	Basic adjustment
Maneuvering and framing	Effects
Advanced effects	

You can see that Photoshop has more basic features than Elements and it has more features and functions. The basic features in Elements are not enough to create all of your images. If you want to design, edit and create a wide range of graphics, then you need a more advanced image editing software. But, this does not mean that Photoshop Elements is bad. Elements is actually easier to use than Photoshop. This makes it a great tool for beginners who need a simple program and want to create images.

**Features of Photoshop** The key features of Photoshop are the basic editing and compositing tools. Because Photoshop is so rich, you can do many things with it. It is a powerful tool that is not as easy to use as Photoshop Elements. But, it can be used by people who are already familiar with photo editing. Here are the

Q: What's the meaning of the following python code?

```
class C: def __init__(self): self.a=4 print self.a def
set_a(self,a): self.a=a print self.a def get_a(self): return
self.a obj=C() obj.set_a(obj.get_a()) print obj.a
```

The output of this is 4 What is the meaning of

obj.set\_a(obj.get\_a())? A: The code does not give a list. Every list starts with a item to add to the list. This means a list is a collection of items. A singleton type is an item. If you create a singleton type, it doesn't really have any interesting properties. This code: class C: def \_\_init\_\_(self): self.a=4 print self.a def set\_a(self,a): self.a=a print self.a def get\_a(self): return self.a obj=C() obj.set\_a(obj.get\_a()) print obj.a Will output: 4 What is the meaning of obj.set\_a(obj.get\_a())? In python, you call a function on a specific object, and that function returns the value of self. This is similiar to the getter and setter functions. The setter function is called with the new value of the object. So the code calls obj.set\_a with the value of obj.get\_a(). The set\_a function stores that result inside obj.a. obj.a is something that is not a property of C. It is something

---

that is a property of the singleton type. It is a list of all of the items in the singleton type. So the output

and build Care, maintenance and daily use Our bodies are not just destined to carry our lives and protect us from various injuries and illnesses. They also provide us a place to live: our home. Therefore, it is important for it to remain in a good condition. The condition of our body does not just depend on what we eat, how we move and what we do. Climate, season, use, age and individual differences can all have an impact on its appearance. By using body oils, we can make sure our skin is protected from the harmful effects of the environment and the way we move. Body Oils The skin is our largest organ, and we should take good care of it, especially in the colder months. Because skin needs direct contact with oxygen to remain healthy, we must ensure to exercise regularly and avoid contact with harmful substances. However, many of us forget this important hygiene rule. Body oils are ideal to protect the skin from the harmful effects of the environment, and to make sure we do not reek during winter – you could always be the first to come across us and leave us in the lurch when you're out in the
