(pixels per inch) to 300 to maintain high image quality; if your photos are taken at higher resolutions, don't worry.\*\* An image displayed at a higher pixel count is usually less pixelated than one at a lower pixel count. Because Photoshop CS5 formats images as 72 ppi, I set the

dpi to 300. **Figure 3-7:**

the photo using Crop

all the other layers to disappear. 5. \*\*In the Layers palette (Windows) or layers panel (Mac), drag a new layer below (below the Background layer) or above (above the Background layer) the Background layer and rename the new layer the same as the Background

the option to change the layer's name. 6. **\*\*Double-click to place a selection frame around the entire photo.\*\*** In the lower-right corner of the Layers palette or layers panel, choose Selection Border from the options available in the Border category. 7.

Q: Why is there a "Time Travel" tag? Using this query: First 250 results, Why is there a "Time Travel" tag? There is no real Time Travel category in Ask Ubuntu but from that list of questions, I see that there are questions

---

which ask to change history, and other questions which are somehow related to time travel. A: Meta Stack Exchange is actually taking over future tags for some of the core tags. This is what the link you shared shows: You can see that Time Travel is one of these: Note that, for some

---

other tags, we're just waiting until the whole process ends, at which point these will be history: The last step here is merging the tags, which will occur during the next maintenance cycle, but we don't usually let people go with the tags they just created.

Controls The Brush tool  
has two main controls: size  
and opacity. If you're  
painting a lot of images or  
applying an effect to them,  
you can save a lot of time

---

by clicking the Brush Size tool's shortcut key, shown below:

1. Press the B key to make the Brush Size dialog box appear.
2. Select Brush Size and press Enter to enter the value in the Brush Size dialog box. If you want to enter a pixel value, type the value in the box.
3. Click OK to exit

---

the Brush Size dialog box. The brush size is the unit of measure for the size of the brush. The Brush Size dialog box shows different brush sizes, as shown in Figure 4-2. It also shows the percentage of brush opacity. The brush opacity is specified as an integer value between 0 and 255.

---

Zero is completely transparent and 255 is completely opaque. The number of brush sizes is relative to your view size, so the actual values in the Brush Size dialog box will differ when you view an image in different sizes. Photoshop starts with a few small brush sizes, and those

---

small brushes are larger as you zoom in to a smaller view. For example, if you start with a size value of 150, the brush size will be 150 as you look at the larger portion of the image. If you zoom in to an even smaller view, the brush size will increase. For example, the brush size will increase

---

to 200 when you view an image at 100 percent size.

**\*\*Figure 4-2\*\*** The Brush Size dialog box As a general rule, you'll never want to go below a size value of 50 in any image. Anything smaller than that simply won't produce a noticeable result on your image. Anything larger

---

than that will make the image too soft and lose image detail. You can view the Brush Size dialog box again to see the values for the current zoom level.

### Selecting a Brush Tip

Shape Photoshop provides a range of brush tip shapes. These shapes, shown in Figure 4-3, are great for

---

applying effects such as stippling or "softening."

**\*\*Figure 4-3\*\*** The six brush tip shapes These six shapes are especially suitable for effects such as stippling, adding a soft, almost translucent glow, or
